6th On-Farm Bull Auction
Tuesday 25th May 2021 - 1pm

Tangiwai Station
1350 Hereheretau Road, Wairoa

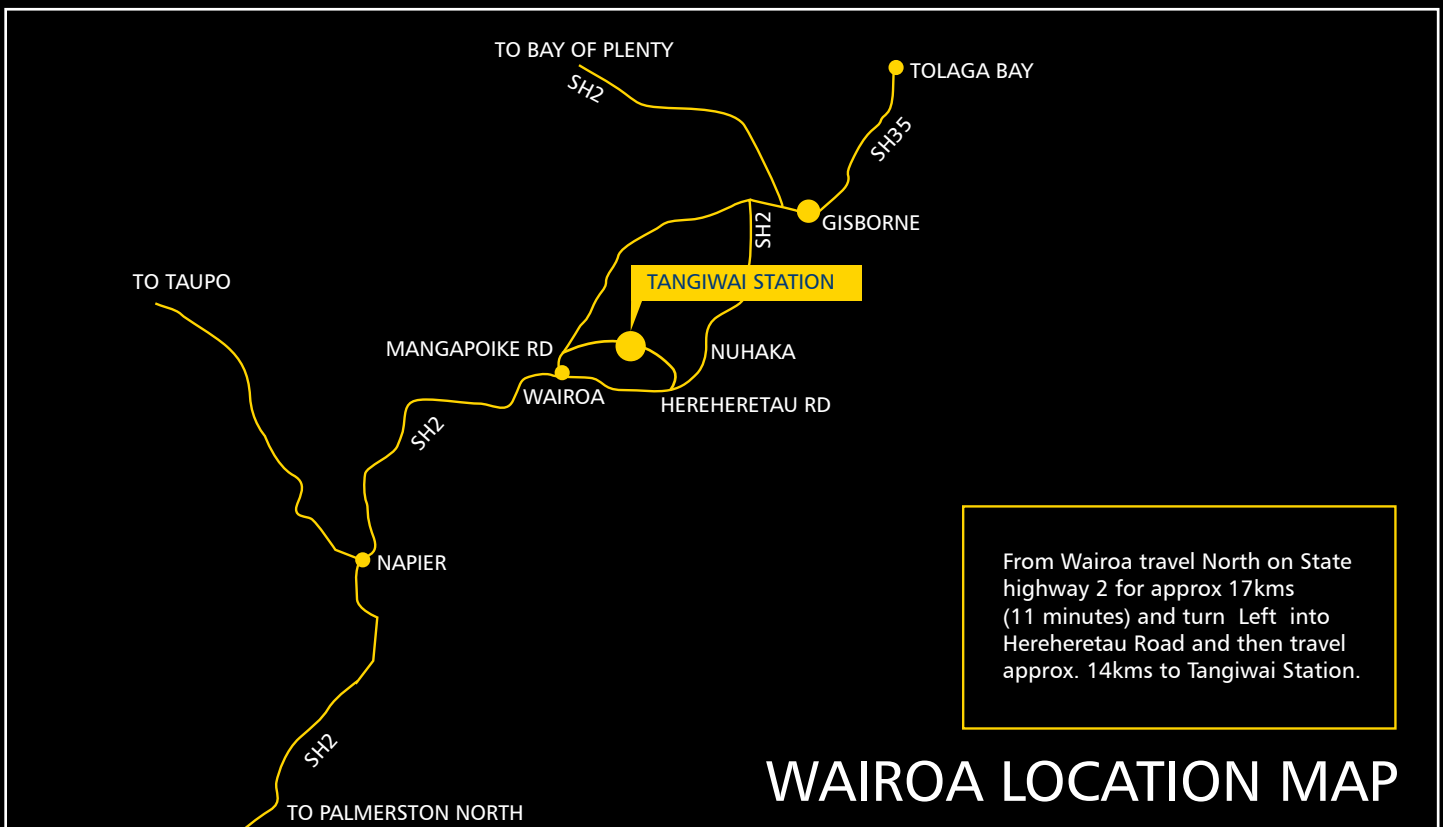

Rising Two Year Bulls for Auction

Tuesday 25th May 2021 - 1pm

at Tangiwai Station, 1350 Hereheretau Road, Wairoa.

(Reasonable cell phone coverage)

All intending purchasers are required to register at the sales office prior to the sale. A purchasing rebate of 6% will then be paid to non-participating livestock companies and recognized independent livestock agents with approved credit facilities introducing and/or accompanying buyers to the sale. Arrangements must be made prior to the sale and settlement made on the purchaser's behalf within 14 days.

KERRAH SIMMENTALS

PROFIT-A-BULL EXCELLENCE

Dear

Well another interesting year has flown by, with farming being a bright light in a somewhat dim Covid world despite the challenges in front of us. It is with great pleasure we present 80+ quality, sound, polled, performance driven young Simmental Sires on Tuesday, 25th May.

We are delighted to be able to bring you the first line up of Neogen 100K tested polled Simmental bulls for sale, guaranteeing parentage, stipulating bulls homozygous for the polled gene and bulls free from the dilution gene.

Practically, what does this homozygous mean? A bull that is homozygous for the polled gene will sire 100% polled calves whatever the cows horn status is. A heterozygous polled bull over horned cows will sire 50% polled and 50 % horned calves and over heterozygous polled cows 25% horned 50% hetero polled and 25% homo polled or over pure Angus cows 100% polled. Scurs are an incomplete development of horns that are detached from the skull and do not need dehorning. The scurred gene is a separate gene still under investigation from the polled gene, but will only be displayed in a heterozygous polled animal so a scurred bull will throw the same percentage polled animals as a hetero polled animal. Note - no bulls in the catalogue have had any dehorning - scurs are as they are.

What does the Dilution gene mean, the dilution gene is a gene that when crossed with a black animal the progeny come out grey/smoky/brown, coat colour whatever your preferred description is. In Simmental, animals affected by the dilution gene are usually called blondes but a lot of the red Simmentals carry a copy in their background so when crossed, give a mix of red/black/smoky grey calves. Here at Kerrah, we have been trying to isolate the dilution gene so that bulls such as lots 20 and 21 will produce nearly all grey calves over angus or Friesian/Hereford or dairy cows and are expressed as A in the catalogue. Bulls marked N are free of the dilution gene and will only produce Black or red calves over black cows and will leave more red and white marked straight bred calves. Bulls that are identified as C, carry a copy of the dilution gene so will leave the range of colouring we are used to.

The Neogen test also gives us a tenderness score and Leptin test but we have not printed the results in the catalogue. All bulls are BVD negative by DNA test. We have now been docility scoring for some years. In the most recent sire search, 9 out of the top 10 sires by docility EBV, were Kerrah bred or used including Food Truck, Fortress, Finetuned - all sires of sale bulls - and Kerrah Go To being used heavily in the stud at the moment.

This year's bulls have been selected from a drop of 240 bull calves and farmed in mobs of 40-50 bulls through to 400 days and scanning. The first 13 lots are all bulls out of 2yr hfrs followed by bulls out of MA cows with Lots 70-80 also 2yr heifers' calves. All bulls put up for sale have passed a service and semen test by Farm Vets Wairoa on the 13th April 2021 or subsequently prior to auction.

We trust a purchase of a Kerrah Bull is an investment in the future profitability of your herd and welcome feedback to help us further in the future direction of the stud.

Regards Jon and the Knauf family

Tangiwai Station

SIZE: 2100 HA (1700 ha effective) purchased by Kevin and Colleen Knauf in 1994

TOPOGRAPHY: Tangiwai rises from 700 – 2300 ft a.s.l. It comprises of 1050 ha of steep hill country, 440 ha medium hill and 120 ha of flats predominately at the Iwitea Block on coast.

STOCK TO WINTERED

SHEEP – 5000 ewes 150% lambing 2019, 1700 hoggets RWR and 1000 winter trade lambs.

CATTLE - 550 Sep/Oct calving cows 97% calving 2019, 100 Jan/Feb calving cows and all progeny through 1 winter.

NB ALL REPLACEMENT HEIFERS MATED AS YEARLINGS

Tangiwai's vision is to produce moderate birth weight, easy calving cattle with explosive growth in an early maturing, polled animal that thrives on hill country. We are committed to producing functional, docile cattle using a balance of proven science, (EBVs, Muscle scanning and DNA verification enhanced EBVs in the future) accurate recording and stockmanship, bred in a challenging Wairoa hill country environment, to deliver profit-a-bull genetics that will last for our clients.

This year has seen another outstanding line of 135 VIC R2 heifers retained whose EBVs are comparable to their brothers in the sale. These heifers had the opportunity of the bull for only 35 days. Last year's calving of the heifers was the smoothest we have ever had with bulls like Crumpy and Efficient giving us calving ease not seen in the breed before, backed up by the results from the Beef and Lamb Dairy Beef Progeny test showing they have birthweight and gestation to match the best of any breed. Add to them Kerrah Gambler and Grumpy and 190267, 190384 and 190498 a great line of homozygous polled bull battery to use over heifers.

The cows saw a great line up of homozygous bulls, headed by Kerrah Go To, an outstanding young sire with performance, phenotype, libido and outstanding docility with his 18 heifer calves and 7 bulls from his yearling mating real standouts in the weaners, with Kerrah Epic, Fortress, Foreman, Goldcoast, Genesis, Grunta, and ylg's 190301 and 190290 making up the a team all homozygous polled. Kerrah Fine Tuned was the only frontline hetero polled bull used. Glenside Frontier, Lonepine G71 and Kerrah Galaxy backing up AI and recipients.

Those clients keeping the daughters from Kerrah bulls should have confidence that they will perform with the best under most conditions. Science has shown that you can expect an 8.5% gain from heterosis in a two way cross and 23% gain in a three way cross for calf weaned per cow mated. Combine this with Simmentals' ability to add milk and growth, and you have a very profitable combination.

Genetic Progress. It is heartening to see that after the initial major investment in cows from all over the country and evaluating them under the rugged conditions at Tangiwai Station, the progress is accelerating. Once again the in calf rate has improved steadily and we now have the calving interval down to 46 days for cows and 36 days for heifers. Kerrah's herd and sale team's average EBVs rank well above breed average for all traits except birth weight. It is great to see Simmental excelling in the Beef and Lamb Progeny Test. Structural soundness and docility has been, and will continue to be, a focus of the Kerrah herd.

PERFORMANCE RECORDS

At Tangiwai, along with the usual structural assessments etc, there is a great belief that to make genetic progress, performance recording is paramount. A large amount of time is invested in this to maximize the accuracy of raw data input. If you put rubbish in you get rubbish out. Put good, accurate data in and achieve the greatest genetic gain – a maxim the stud believes in. Combine this with the large size of management groups and you have meaningful data to work with. On average, the generated breeding values from Kerrah have a 10% higher accuracy than other Simmental 20 month sale bulls.

This year we have included the Docility EBV as well as the docility score. I think the score gives a quick categorised overview taking into account the EBV and the bulls actual temperament.

A bull with 1 or 1.5 is seen as a docility improver, of which there are plenty this year, a 2 satisfactory and 2.5 on the lower end of what we offer.

A big thankyou to all our staff, Shayne Walker, Tiffany Trott, Turei White and my family – wife Sam, Children- Josh and Nickayla, Lauren, Tessa and Ben and my mum Colleen for their continued support. Thanks again to Alastair Milne for his continued support and input. We are sorry Alastair cannot be with us this year but wish him all the best with his new knees!

Also thanks to Ross and Phil who also do their best to ensure your bulls' transport to their new home is as cost effective and smooth as possible, wherever in the country you may be.

The Kerrah team wish you well with your new purchases. Please remember that we welcome your feedback, both positive and negative. It is very important to us to know how the bulls are performing to help refine the future breeding program.

Kerrah Simmental Sale

RECOMMENDATIONS

We appreciate that it is not always easy to turn up on sale day and make the all important decision of which bull to buy. To help with this we have coded our recommendations for what breeding policy we believe each bull is best suited for. This is based on not only the bulls own records but how his family has performed in the herd.

CODES

H1 – this means the bull is suitable for mating well grown beef yearling heifers. It is based on the bulls EBV's for birth weight and calving ease combined with the knowledge on the performance of the sire and the dam.

H2 – means the bull can be used with confidence for mating two year old heifers or second calvers and dairy cows.

M – This bull we consider most suitable for retention of his daughters, based not only on the EBV's for birth, calving ease, scrotal circumference and milk but also on scanning data and the ability of the mother and her family to get back into calf each year.

T – These sires are most suitable for producing top weaners which have the ability to grow on and be ready for slaughter at 20 months of age.

Note – A bull can have more than one code. Also note that breed indexes are another easy system to use if you are not worried about emphasis on a single trait. (see under EBV's explained for more information on these – page 4).

DILUTION GENE CODES

A – Carries the Dilution gene.

N – Carries no Dilution gene.

C – Carries one copy of the Dilution gene.

See letter for explanation.

There are some bulls in the catalogue with the dilution gene notation missing. These are awaiting test results and should be on hand by Sale Day.

Guarantees

All Kerrah bulls are guaranteed for 2 years from date of sale against structural unsoundness, infertility or incapability of service. Under these circumstances Kerrah will:

- Replace the bull with a satisfactory substitute if available, or:
- Issue a credit equal to the purchase price less the salvage value.

This credit may be used at future Kerrah bull sales.

The guarantee covers the purchase value of the bull without interest, cost or damages. The guarantee shall apply providing the bull's incapacity is not caused by injury or disease contracted since leaving Tangiwai and is calculated on the basis that the guarantee is reduced by one third of the purchase price for each year of standard service from the sale date. A veterinary certificate must be supplied by the purchaser upon request.

If any bull that is purchased does not possess a reasonable fertility, although not totally infertile, any dispute that may arise shall be settled by an arbitrator appointed by the auctioneers and must be lodged within 12 calendar months from date of sale.

We recommend that all purchasers discuss injury insurance of their bulls at the sale.

HEALTH

The Kerrah herd is assessed annually for general health, udder, feet and temperament defects, all animals not meeting a high standard are culled.

All Auction bulls have been palpated, scrotal measured and Semen and Service tested on the 13/4/2021 by Farm Vets Wairoa. They have been given a 10n1 and BVD booster. All bulls have been DNA tested negative for BVD. Kerrah is a Brucellosis free and TB accredited herd and carries a C10 status.

ON OFFER

ADVISORY SERVICE

We welcome the opportunity to become involved in your breeding program, to give another opinion, to bounce ideas off and get feed back from the breeding program.

TRANSPORT

We offer free transport to the value of \$200 or transport to one of the following destinations - Hamilton, TeKuiti, Feilding, or Wanganui. Please fill in the transporters section in the purchaser's slip as being in touch with the transport firm you deal with most often can both reduce the time in transit and ease the cost of getting your bull home.

BACK-UP SERVICE

If you have problems during mating or though the year we will endeavour to help by supplying a back up bull, with the option of purchasing him if satisfied. With the help of our agents and knowing what transport firm you use, delivery can usually be swift.

BIDR CONDITIONS

This sale will be hosted by bidr® (www.bidr.co.nz) as a HYBRID auction, with online bidding and a live-stream available on sale day, as well as the normal on-farm format. All intending ONLINE purchasers must register on bidr® in advance of the sale date, by visiting the website and using the "sign up" button, adding their contact information and nominating the agency they would like to purchase through and account held with that agency. Alternatively, purchasers can organise an agent from one of the agencies listed on bidr® to buy on their behalf. The bidr® team is always available to help purchasers get signed up and registered, and the HelpDesk is proudly managed in-house from the Waikato. Please call 0800 TO BIDR (0800 86 2437), or email enquiries@bidr.co.nz for assistance at any point.

EBV's Explained

ESTIMATED BREEDING VALUES (EBV'S)

An EBV is the best estimate of an animal's genetic merit for that trait.

CALVING EASE: Calving ease are based on calving ease scores, birth weights and gestation length information. More positive EBV's indicate easier calving.

DIR: Direct Calving Ease indicated how this animal influences the birth of it's progeny.

BWT: Birth Weight EBV (kg) is based on the measured birth weight of animals, adjusted for dam age. The lower the value the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

200: 200 Day Growth EBV (kg) is calculated from the weight of animals taken between 80 and 300 days of age. Values are adjusted to 200 days and for dam age. This EBV is the best single estimate of an animals genetic merit for growth to weaning.

400: 400 Day Weight EBV (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for dam age. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

600: 600-Day Weight EBV (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and dam age. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

Scrotal Size EBV (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

MILK: 200-Day Milk EBV (kg) is an estimate of an animal's milking ability. For sires, this EBV is indicative of their daughter's milking ability as it affects the 200 day weight of their calves.

CWT: Carcase Weight EBV (kg) estimates the genetic difference in carcase weight at a standard age of 650 days. More positive EBVs indicate heavier carcasses at 650 days of age.

EMA: Eye Muscle Area (cm²) estimates genetic difference in eye muscle area at the 12/13th rib state of a 300kg dressed carcass. More positive EBVs indicate better muscling on animals.

RIB FAT: Rib Fat EBV (mm) estimates the genetic differences in fat depth at the 12/13th rib in a 300 kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

P8 FAT: Rump Fat EBV (mm) estimates the genetic differences in fat depth at the P8 site of a 300kg dressed carcass. More positive EBVs indicate more subcutaneous fat and earlier maturity.

Retail Beef Yield EBV (%) indicates genetic differences between animals for retail yield percentage in a standard 400 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

ACTUAL MEASUREMENT:

SS: Yearling Scrotal: Scrotal Circumference is an indicator of male fertility as expressed in semen quality and quantity. The larger the circumference indicates higher fertility. Scrotal Circumference is also highly correlated with early puberty in their daughters. This is why we measure bulls as yearlings for their EBVs as this is when we want our female to reach puberty. We also measure them again prior to sale, the reason, the bigger they are the more "marbles" in the pouch, potentially the more cows he can serve. The measurement in the catalogue was taken at 18 months.

ACE: Accuracy (%) is based on the amount of performance information available on the animal and its close relatives - potentially the number of progeny analysed. It indicates the "confidence level" of the EBV. This is why at Tangiwai both female and male data are analysed. 560 animals to the weaning stage (200 days), 500 to the yearling stage (400 days) and scanning.

UNDERSTANDING THE INDEXES:

Index values are provided for each bull. These allow the expected profitability of the progeny of different bulls to be compared.

The Maternal Index compares sires on the basis that a proportion of their female progeny will be retained in the herd as breeding replacements. The Terminal Index compares sires on the basis that all progeny will be finished for slaughter (no females retained for breeding).

Also to note, is that indexes are a good tool but their limitation is key traits have a big influence on the index value and operate on the premise more is always better rather than a threshold. At Kerrah we aim to breed balanced cattle trying to avoid extremes of traits as most often there is an antagonistic trait or traits associated with a favourable trait. All said and done, we are still trying to breed a Polled, phenotypically pleasing, docile bull in the top 20% for every trait and index.
