# EARNSCLEUGH

HIGH COUNTRY HEREFORDS, ANGUS AND COMPOSITE

37<sup>th</sup> ANNUAL SALE  
FRIDAY 10<sup>th</sup> JUNE 2022 – 1.00 PM

Earnsleugh Station High Country Genetics

**Helmsman Auction**  
**OFFERING FOR SALE:**

51 Angus — 30 Poll Herefords — 32 Composite (Red & Black)

At Earnsleugh Station all cattle are:

Weighed at birth; TACE recorded; Scan Carcase Traits; Scrotum Measurements; Limited mating season;

Cattle run under South Island High country conditions; TB & Brucellosis accredited C10;

Bulls blood tested free of BVD and vaccinated; Free cartage to South Island and to Feilding in the North Island.

## BULL SALE 2022

Firstly a big thanks to all bidders and purchasers from last year's sale. Your support is very much appreciated, and we hope your bulls have done a great job for you. If for any reason you are unhappy with your purchase, please contact us as we stand behind all our bulls.

If you are reading this on our online e-catalogue please click on the pictures below each animal for a short video of the bull.

Earnsclough Station has a policy of challenging all its cows to get in calf and forage hard to maintain their weight and consequently get in calf the next year. We have the distinct advantage that we can run cows very cheaply on the hill and tussock. If we were to get all the cows get in calf, then we wouldn't be exposing the new bloodlines we are bringing in to enough challenge for us to identify which lines of cattle are strong foragers and can get in calf at a lower weight. The dry cows are sent to the works.

This year the sale will run "as normal" on the big board, but we will have the extra option of text bids for those who don't want to use the paper in the shed or wish to bid remotely. To do this, when you register if you ask to phone bid and our excellent office team will set it up on your phone. Bids will be collected and go through the board as normal.

If you wish to bid off site, we will be livestreaming the board on either facebook or our website or both. All you need to do is ring and register and we can set you up. You will be able to follow the sale real time and make text bids.

Please get in touch if you have any questions or wish to view the bulls before the sale. Or even if you'd like to have a yarn about you upcoming bull needs on any of the numbers below.

## STUD MANAGEMENT

Earnsclough's policy has always been to treat the stud cattle in a similar fashion to our High Country client's herds. This means that while our bulls will not carry the condition of those from more favourable areas, their genetic ability to pass on growth is not affected and their ability to shift is greatly enhanced.

Earnsclough Stud females are run entirely on semi-improved and native tussock country where they are subjected to the same pressures expected of commercial cattle. Under these conditions, cattle that don't have a strong constitution and the ability to walk and forage will show up and are culled.

To stay in the stud, heifers must:

- > get in calf after synchronised AI then 21 days to the bull,
- > calve unassisted
- > rear a calf with a high weaning weight.

The bulls are weaned to Fruitlands onto grass and wintered on brassicas and then finished on grass.

## CONDITIONS OF SALE

The sale will be conducted in accordance with Conditions of Sale as set down by the Stock and Station Agents Association. A copy of which will be exhibited at the Sale.

### **Insurance**

Purchasers are strongly advised to insure all cattle prior to transit. Insurance representatives will be available on-Sale Day.

### **Overseas Conditions**

All Sales to overseas buyers are conditional on the cattle passing the necessary tests for importation into the purchaser's country.

### **Other Conditions**

1. All buyers are required to register with the booking clerk prior to the sale. Sale Pens and Lots (will be sent separately).
2. Every effort has been made to present the information in this catalogue accurately. No responsibility is accepted for the use of or interpretation of the information on the animals included in this catalogue or for the accuracy of information herein.
3. Each lot offered will carry the Vendor's personal guarantee of fertility or your money back.
4. The order of sale may not be as catalogued
5. All lots sold are exclusive of GST.
6. TB accredited herd - C10

### **Semen Rights**

Earnsclough Station Ltd reserves the right to collect semen from any bull in this catalogue. Collection will be at our expense and at a time that is at the purchasers convenience. Semen collected will be for use only within herds owned or contracted to Earnsclough Station Ltd.

## BEEF-CLASS STRUCTURAL ASSESSMENT GUIDE

### How to do Beef-Class Structural Assessments

For docility- 1 is Ideal (Docile), 3 is less ideal (restless) and 5 is aggressive. (Scores of 1 and 2 are preferred).

For traits scored 1-9:

- 4 and 6 show slight variation from ideal but this includes most animals. Any animal scoring 4 and 6 would be acceptable in any breeding program.

- 3 and 7 shows greater variation, but would be acceptable in most commercial breeding programs, but seed stock producers should be wary.

- 2 and 8 are low scoring animals and should be looked at closely before purchasing.

- 1 and 9 should not be catalogued and are considered culls.

| Trait                                                   | Key                    | Scoring Range                                                                                                                                                                                                                                                              |                                                                 |

### EARNSCLEUGH COMPOSITES BREEDING PROGRAM

To maintain a minimum of 70% of maximum hybrid vigour we must continue to introduce purebred genetics at regular intervals. It is very important that those purebred animals are top performers within their breed or the benefits of hybrid vigor could be lost due to lower production in the base breeds.

Top cows from our Hereford and Angus studs are used for ET. For breeds we don't have on site we lease and flush eggs from breed leading donor cows.

Crossbreeding beef cattle offer two primary advantages relative to the use of only one breed: 1) crossbred animals exhibit heterosis (hybrid vigour), and 2) crossbred animals combine the strengths of the various breeds used to form the cross. The goal of a well-designed, systematic crossbreeding program is to simultaneously optimize these advantages of heterosis and breed complementarity.

The amount of heterosis expressed for a given trait is inversely related to the heritability of the trait. Heritability is the proportion of the measurable difference observed between animals for a given trait that is due to genetics (and can be passed to the next generation). Reproductive traits are generally low in heritability (less than 10%), and therefore respond very slowly to selection pressure since a very small percentage of the differences observed among animals is due to genetic differences (a large proportion is due to environmental factors). The amount of heterosis is largest for traits that have low heritabilities. This has significance for commercial breeding systems, as crossbreeding can be used to enhance reproductive efficiency. To date, the ability to select for reproduction is limited (ie. there are no EPDs for reproduction).

## THE AMERICAN SIMMENTAL ASSOCIATION AND WHY

Ever since we started the composite cattle we have been unhappy with the figures we have been receiving. This is because each new bull we introduce was brought into the database with figures of zero across the board. This gives his progeny half the value of the dam and nothing from the bull for the first year. The resulting values are meaningless when compared to calves out of a different bull on the same year where the other bull has been used for several seasons and has accumulated some data. Zeros are also unrealistic when we continually purchase top genetics with top data. The American Simmental Association is a true multi breed program where cattle from many different cooperative breeds can be directly compared. Currently there are over 18 million head recorded within the Association with near to 400,000 animals recorded annually. The American Angus association also runs 11 million EPDS (Estimated Progeny Differences) through the same database. We are very excited to be able to directly compare our animals with so many cattle worldwide and we believe the genetic enhancement in our stud will be through the roof.

On top of this we now have a place for our genomically enhanced breeding values and once we are happy with their linkage to the database, we will be able to offer DNA enhanced heifer selection for our clients as well.

We travelled to Montana to visit the Association personally July 2019 and were very impressed with the efficiency and technologically advanced system. It has a very forward-thinking board who continually experiment in improving cattle and how they breed. We are very excited to have a Stay Ability EPD now, we believe it is the single most important figure that can be generated. Stay ability (STAY) is a percentage of cows from a sire still in the herd at age 6 so it considers culling for feet, type, fertility and production, or any reason a cow may not last.

The financial success of cow calf operations depends on a cow's ability to remain in the herd long enough to recoup the cost of heifer development and cow maintenance. To achieve this, a heifer needs to calve as a 2 year old and produce a calf each subsequent year. STAY EPD was developed to predict this reproductive success or failure and is defined as "a

## COMPOSITE

cow's ability to remain in the herd to a specific endpoint with the assumption that dry cows are culled". We cull all dry cows. A couple of simple examples.

The daughters from bulls in the top 25% for stability are more than twice as likely to remain in the herd as 6 year olds compared to the bottom 25%

Put another way daughters from bulls in the top 25% for stability averaged almost two more calves in their lifetime compared to daughters of bulls in the the bottom 25% which is economically huge in a cow breeding system

The only reservation we have at the moment is our linkage with the database. We have NZ bred and home bred animals in the herd that we have now established online with the ASA. Those who have sires from the USA are going to rank higher earlier than the home breds. However within a few years this will stabilise and we are using as many bulls as we can that are linked firmly to the database to improve this quickly.

## QUICK REFERENCE TO ASA EPDS AND \$ INDEXES

Expected Progeny Differences (EPDs): EPDs are the most accurate and effective tool available for comparing genetic levels. In using EPDs, the difference between two sires' EPDs represents the unit difference expected in the performance of their progeny. For example, if sires A and B have EPDs of +10 and -5, a 15-unit difference would be expected in their progeny (moving from -5 to +10 yields 15 units). Key to using EPDs is knowing what units they are expressed in. For example, if the above case referred to weaning weight EPDs, A would be expected to sire 15-pounds more weaning weight than B. If calving ease were the trait, A would be expected to sire 15-percent more unassisted births in first-calf heifers; in other words, if B sired 30 assists in a group of 100 heifers, we'd expect A to require 15 assists. A percentile-ranking chart is required to determine where a bull's EPDs rank him relative to other bulls in the breed. For percentile rankings or more detailed information about EPDs and \$ indexes visit [www.simmmental.org](http://www.simmmental.org). Listed below are the units ASA EPDs are expressed in:

**All-Purpose Index (API):** Dollars per cow exposed under an all-purpose-sire scenario. (See overleaf for more details.)

**Back Fat (BF):** Inches of backfat.

**Birth Weight (BW):** Pounds of birth weight.

**Calving Ease (CE):** Percent of unassisted births when used on heifers.

**Carcass Weight (CW):** Pounds of carcass weight.

**Maternal Calving Ease (MCE):** Percent of unassisted births in first-calving daughters.

**Milk (MLK):** Pounds of weaning weight due to milk.

**Marbling (MRB):** Marbling score.

**Maternal Weaning Weight (MWW):** Pounds of weaning weight due to milk and growth.

**Ribeye Area (REA):** Square inches of ribeye.

**Warner-Bratzler Shear Force (WBSF):** Pounds of force required to shear a steak.

**Stayability (STAY):** Percent of daughters remaining in the cowherd at 6 years of age.

**Terminal Index (TI):** Dollars per cow exposed under a terminal-sire scenario. (See overleaf for more details.)

**Weaning Weight (WW):** Pounds of weaning weight.

**Yearling Weight (YW):** Pounds of yearling weight.

**Yield Grade (YG):** Yield grade score.

## COMPOSITE

**\$ Indexes:** Though EPDs allow for the comparison of genetic levels for many economically important traits, they only provide a piece of the economic puzzle. That's where \$ indexes come in. Through wellconceived, rigorous mathematical computation, \$ indexes blend EPDs and economics to estimate an animal's overall impact on your bottom line. The same technology that led to the dramatic progress in swine, poultry and dairy genetics over the last several decades was used to develop the following \$ indexes:

**All-Purpose Index (API):** Evaluates sires for use on the entire cow herd (bred to both Angus first-calf heifers and mature cows) with the portion of their daughters required to maintain herd size retained and the remaining heifers and steers put on feed and sold grade and yield.

**Terminal Index (TI):** Evaluates sire for use on mature Angus cows with all offspring put on feed and sold grade and yield.

**Using API and TI:** First, determine which index to use; if you're keeping replacements use API, if not, TI. Then, just as with EPDs, zero in on the unit difference between bulls. (As described above, index units are in dollars per cow exposed.) The difference can be used to determine how much a bull is worth compared to another. Or, put another way, how much you can pay for one bull compared to another. For example, when buying an all-purpose-type sire, you can quickly figure a bull scoring +100 for API is worth an extra \$6,000 over a +50 bull if both are exposed to 30 cows over 4 years ( $\$50 \text{ diff.} \times 30 \text{ hd.} \times 4 \text{ yr.} = \$6,000$ ). A percentile-ranking chart is required to determine where a bull's index value ranks him relative to other bulls in the breed. For percentile rankings or more detailed information about EPDs and \$ indexes visit [www.simmental.org](http://www.simmental.org).

**Comments:** We have been using Achillies for a few years now. He always breeds thickness on any frame and very good temperament

**Comments:** Last crop, bought in 2013. He has had 8 years of calves and still is as sound as ever and is the biggest bull on the place. Always holds his weight and breeds heavy boned, grunty cattle.

**Comments:** A real star of the hybrid market in USA. No holes phenotype and great data with it. One of the most heavily used bulls overseas and from his progeny we can see why

**Comments:** Tidy cattle with lots of width and style. He has a good line of sons this year

**COMMENTS:**  
Very low birth weight but still plenty of growth, on a tidy shouldered bull. Out of a heifer and should be good to go back over them

## UNDERSTANDING TRANSTASMAN ANGUS CATTLE EVALAUTION EBV

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as + ive or - ive differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Day Weight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait.

Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals within the same analysis. Consequently, TRANSTASMAN ANGUS CATTLE EVALUATION EBVs cannot be validly compared with EBVs for any other breed.

Although EBVs provide an estimate of an animal's genetic merit for a range of production traits, they do not provide information for all of the traits that

must be considered during selection of functional animals. In all situations, EBVs should be used in conjunction with visual assessment for other traits of importance (such as structural soundness, temperament, fertility etc). A recommended practice is to firstly select breeding stock based on EBVs and to then select from this group to ensure that the final selections are otherwise acceptable.

EBVs are published for a range of traits covering fertility, calving ease, milking ability, growth, carcass merit and feed efficiency. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important to the particular herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance.

**Calving Ease EBVs (%)** are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

**CE % Direct = Direct Calving Ease** - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

**CE % Daughters = Daughters' Calving Ease** - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

**Gestation Length EBV (days)** is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

**Birth Weight EBV (kg)** is based on the measured birth weight of progeny, adjusted for dam age. The lower the value, the lighter the calf at birth and

the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

**200-Day Growth EBV** (kg) is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

**400-Day Weight EBV** (kg) is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

**600-Day Weight EBV** (kg) is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

**Mature Cow Weight EBV** (kg) is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

**Milk EBV** (kg) is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

**Scrotal Size EBV** (cm) is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection for increased scrotal size will result in reduced age at calving of female progeny.

**Days to Calving EBV** (days) indicates the fertility of the daughters of the sire. It is the time interval between the day when the female is first exposed

to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility.

**Carcase Weight EBV** (kg) is based on abattoir carcase records and is an indicator of the genetic differences in carcase weight at the standard age of 750 days.

**Eye Muscle Area EBV** (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcase data, adjusted to a standard 400 kg carcase. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 400 kg dressed carcase. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcase weight than will sires with lower EMA EBVs.

**Rib Fat and Rump Fat EBVs** (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 400 kg carcase. These EBVs are indicators of the genetic differences in fat distribution on a standard 400 kg carcase. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcase weight than will sires with higher EBVs.

**Retail Beef Yield EBV** (%) indicates genetic differences between animals for retail yield percentage in a standard 400 kg carcase. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

**Intramuscular Fat EBV** (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 400 kg carcase. Depending on market targets, larger more positive values are generally more favourable.

**Docility EBV** (%) is an estimate of the genetic differences between animals in temperament. Docility EBVs are expressed as differences in the percentage of progeny that will be scored with acceptable temperament (ie. either "docile" or "restless").

# ACCURACY

## Accuracy

**Accuracy (%)** is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the "confidence level" of the EBV. The higher the accuracy value the lower the likelihood of change in the animal's EBV as more information is analysed for that animal or its relatives. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal's genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease.

| ACC RANGE     | INTERPRETATION                                                                                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| less than 50% | EBV should be considered as a preliminary estimate. It could change substantially as more performance information becomes available.                                                            |
| 50-74%        | Medium accuracy, usually based on the animal's own records and pedigree. Still subject to substantial changes with more information, particularly when the performance of progeny are analysed. |
| 75-90%        | Medium - high accuracy and includes some progeny information. Becoming a more reliable indicator of the animal's value as a parent.                                                             |
| more than 90% | High accuracy estimate of the animal's true breeding value. It is unlikely that the EBV will change much with the addition of more progeny data.                                                |

Accuracy values range from 0-99%.

As a rule, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

For further information please contact NZ Angus or TACE.

### Please Note:

There has been a review of Angus Indexes but with the same labelling. An explanation of the new indexes is provided in the catalogue.

In simple terms,

The Self Replacing Index (SRI) is made to be used by properties where the herd is exposed to prolonged seasonal feed deficits and feeding supplement is unlikely.

The Angus Pure Index is for properties where the herd can be managed with extra feed if a seasonal deficit occurs.

These changes have meant the averages for indexes have changed significantly so index values cannot be compared with previous years.

# SELECTION INDEXES

## INDEX DESCRIPTIONS

There are currently three selection indexes calculated for New Zealand Angus animals. These are Self-Replacing, AngusPure and Heifer/Dairy Terminal. Each selection index describes a different production/market scenario and relates to a typical commercial herd in New Zealand that is targeting the following specifications.

Index values are reported as EBVs, in units of relative earning capacity (\$) for a given market. They reflect both the short-term profit generated by a sire through the sale of his progeny, and the longer-term profit generated by his daughters in a self-replacing cow herd. The Index values are derived using BreedObject technology. More information is available from the BreedObject web site.

**Self-Replacing Index (\$)** - Estimates the genetic differences between animals in net profitability per cow joined in an example self-replacing commercial herd that targets the production of grass finished steers. Steers are assumed marketed at approximately 480 kg live weight (265 kg carcass weight and 7 mm fat depth) at approximately 16 months of age. Selected heifers are retained for breeding and the balance marketed at approximately 16 months weighing 415 kgs (230 kg carcass weight and 8 mm fat depth). As some daughters are retained, maternal traits are also of importance.

**AngusPure Index (\$)** – Estimates the genetic differences between animals in net profitability per cow joined in an example self-replacing commercial Angus herd that targets the production of grass finished steers for the AngusPure programme. Steers are assumed marketed at 530 kg live weight (290 kg carcass weight and 10 mm fat depth) at approximately 20 months

of age. Selected heifers are retained for breeding and the balance marketed at approximately 20 months weighing 450 kg (240 kg carcass weight and 10 mm fat depth). A significant premium for carcass quality was assumed and, as some daughters are retained, maternal traits are also of importance.

**Heifer/Dairy Terminal Index (\$)** – Estimates the genetic differences between animals in net profitability per female joined in an example herd where all progeny are marketed. All progeny are marketed at approximately 510 kg live weight (280 kg carcass weight and 7 mm fat depth) at approximately 24 months of age.

Note that \$Index values for individual animals are sensitive to the assumptions used in the BreedObject analysis to calculate the selection index.

# ANGUSPURE PARTNER STUD

AngusPure NZ has teamed up with 87 Angus studs who share in our vision - to focus on the end consumer. This stud is proud to be named as one of them, and by using the finest genetics and implementing best management practice they can help you produce more premium quality Angus beef.

Only our AngusPure Partner studs display these devices in their sale catalogues. They indicate bulls endorsed by AngusPure NZ.

## ANGUSPURE ENDORSED BULLS

AngusPure NZ continues to endorse bulls for sale that are either at or above +\$120 for the AngusPure index (API) and at or above \$107 for the AngusPRO index (PRO). These indexes give commercial farmers confidence that by using these selection tools, bulls are most likely to leave progeny with superior carcase quality. At the same time they achieve desirable outcomes for self replacing herds, as the AngusPure & AngusPRO indexes still reward cattle with strong maternal attributes like calving ease, scrotal and growth, along with carcase weight.

**To qualify, bulls will be => +\$120 for AngusPure index  
OR => +\$107 for AngusPRO index**

## EXTRA ANGUSPURE ENDORSEMENT FOR MARBLING

In addition to the 'A', and to assist bull buyers who wish to select for more marbling we are rewarding those animals that are either at or above +\$140 for the AngusPure index and at or above \$126 for the AngusPRO index. In addition to this they must have an IMF EBV (for marbling) equal to or greater than +2.0. These bulls will be awarded an 'A+' endorsement. Marbling is one of the very highest eating quality attributes and is necessary in order to meet some of the highest premium requirements for our export program, AngusPure Special Reserve.

**To qualify, bulls will be => +\$140 for AngusPure index OR => +\$126 for  
AngusPRO index, and in addition all bulls must be => +2.0 for IMF EBV**

AngusPure NZ recognises the need to lift the amount of marbling in our New Zealand cow genetics, in order to fill the requirements of consumers going forward. Marbling has two critical components; genetics and feeding. Feeding on a rising plane of nutrition is vital but without the genetics these attributes will not be able to express themselves.

# BRED FOR BALANCE

As a member of AngusNZ you can be assured that the **INDEX DATA** provided in this catalogue specifically relates to New Zealand's environmental conditions and market.

**PROUD TO BE PART  
OF ANGUSNZ**

**ANGUS**  
NEW ZEALAND

[angusnz.com](http://angusnz.com)

## ANGUS BACKGROUND

Earnsleugh Angus Stud was established in 1997 with the purchase of the two top cows from the Waitapu female sale including Lulu 560, the top priced female.

In 1998 and 1999, five further Waitapu females and one from the Maunu dispersal were added. These top females, through embryo transplant, are responsible for 180 progeny to date, with 73 daughters retained in the stud. A few selected females were purchased from Eden Bank and The Glade dispersals, including the top priced lot at each. The complete lines of 1 and 2 year heifers from the Rowallan dispersal were purchased.

On the maternal lines we purchased a number of heifers from the Braxton dispersal sale in 2009. Of these cows a number have gone on to produce sale bulls. The Rowandale cows have produced good bulls and some nice replacement females.

In the Angus breed we are aiming to retain bone and ease of doing on moderate frames while still having top data. We are pleased with the direction they are heading and had our confidence reinforced after using Bill Austin this year as an independent structural assessor. We believe strongly in maintaining excellent temperament in all our cattle as we have long periods where they are not fed out to or handled.

**When the sale bull has outstanding EBVs you will find these highlighted.**

**If the EBV is in the Top 25% of the breed, the EBV will be in dark red.**

**If the EBV is in the Top 50% of the breed, the EBV will be in pink.**

Soft fleshy cattle. Square and well put together. Great for crossing over pretty much anything. A good honest bull.

Plenty of fat and fertility data, should breed cows that are easy to get in calf.  
This bull has power and volume but carries it well.

## Hereford Background

The Earnsclough Hereford Stud was established in 1977 with heifers purchased from the Broadacre, Waikaka, and Glacier studs.

In 1981 we purchased the complete line of cows with calves at foot from Reeve Williams of Glacier Stud. Selected females were added from the Clachanburn, Eriskay, and Broadacre dispersals. In 2007 we Purchased 33 in calf females from the Roselawn dispersal and in 2008 a few selected females from the Leader dispersal.

In 2011 we purchased the Stanfield Polled Hereford Herd including the pick of the yearling bulls.

The horn/poll status background of all the Hereford lots can be determined by the letters

J, P, H, or S after the animals name in all pedigrees.

|   |                       |
|---|-----------------------|
| J | Pure Horn             |
| P | Polled                |
| H | Horns with Poll blood |
| S | Scurs                 |

**When the sale bull has outstanding EBVs you will find these highlighted.**

**If the EBV is in the Top 25% of the breed, the EBV will be in dark red.**

**If the EBV is in the Top 50% of the breed, the EBV will be in pink.**

### Please note

There has been a review of the Hereford Indexes and new labelling.

The two beef cattle indexes are now called Hereford Prime index and Beef Heifer Index

An explanation of these is provided in the catalogue

### In simple terms,

If buying bulls for a cow herd, then use the Hereford Prime Index.

If buying a bulls to put over heifers or breeding for the dairy market, then use the Beef Heifer Index.

Please note that the index values including the averages have changed so are not comparable to last year.
